WILBERT KRUSKIE

Melbourne, VIC · (61) 0423 000 802 · wilbertkruskie@gmail.com · LinkedIn · GitHub

PROFESSIONAL SUMMARY

Computer Science graduate (Swinburne, Feb 2026) who has shipped commercial software and fixed it when it broke. A year as the only developer on a Shopify product: found and fixed the fault that was stopping anyone installing it, took a 224-module scan engine's outbound requests during a run to zero without changing a module or a test, and left it running on 1,100+ passing tests. On a separate codebase, closed six access-control defects that let any signed-in user read another user's records. Delivered a nine-month project to an external industry client in a team of five. Melbourne based and available now.

EXPERIENCE

Full Stack Developer | Third Cache — Dec 2025 -- Apr 2026 · Sunbury, VIC (Hybrid)

TypeScript · React · Python · FastAPI · PostgreSQL · Redis · REST APIs · Git

- Built the customer-facing interface in React and TypeScript, and designed and maintained 111 REST API routes across four backend services over a 21-table PostgreSQL schema.
- Integration was most of the job: OAuth, JSON payloads, webhooks, and the failures that come from depending on a platform I cannot change.
- Fixed the fault stopping anyone installing the product. It presented as an OAuth redirect loop and looked like a misconfigured callback URL. It was the session created during the handshake not surviving to the next request.
- Rebuilt a 224-module engine to read from a pre-fetched cache through drop-in components matching the old interfaces exactly, so outbound requests during a run went to zero and no module or test changed.
- Maintained 1,100+ passing tests and a written log of 30+ technical decisions.

Software Developer, Industry Capstone | Digital Village · Team of 5 — Feb -- Nov 2025

React · Supabase · OpenAI API · Git

- Built the React frontend of a client-facing platform and owned testing across a nine-month delivery to an external industry client.
- Integrated the OpenAI API to evaluate user responses against a structured skills framework.
- Worked to a shared branching workflow in a five-person team, with code review before merge.

Business Analyst Intern | 99aupairs — Jan -- Feb 2026

Zoho CRM · Process Automation

- Mapped a failing manual process that was causing customers to be missed, decided which steps were safe to automate, and built the workflow that replaced it.
- Tested SophiieAi, an AI customer-service platform under evaluation, and documented two reproducible defects.
- Awarded the Positive Impact Award for contribution during a two-month internship.

PROJECTS

PlanForge | Personal Project — 2026

Hono & Bun · TypeScript · Supabase · Automated Testing · CI

- Found and fixed six broken-access-control defects where handlers used a service key that bypasses row-level security, so any signed-in user could read or modify another user's records.
- Replaced whole-body updates with an explicit writable-field allowlist to close a mass-assignment path, added a shared ownership check, and wrote 11 cross-user tests running in CI on every push.
- Ran the new suite against the original unpatched handlers and found one test passed anyway, because a mocked dependency ignored the filter under test. AI-assisted tests need checking against known-broken code before they are trusted.

Zombie AI Simulation | University Project — Feb -- Jun 2025

Python · A Pathfinding · Benchmarking*

- Profiled the pathfinding and found each call rebuilt score tables across all 40,000 grid nodes before searching; replaced them with lazy lookups and a closed set, cutting median path computation from 11.6 ms to 2.6 ms, verified byte-identical across 120 routes against a breadth-first ground truth.

ISS Overhead Notifier | Personal Project — 2025

Python · REST APIs · SMTP

- Polls the ISS position and sunrise/sunset APIs for a fixed location and sends an email only when the station is overhead and the sky is dark, so the two conditions have to hold together.

Finance Tracker | University Project — 2024

PHP · Vue.js · Chart.js · MySQL

- Expense logging by category over a relational schema, reported back as bar and doughnut charts.

TECHNICAL SKILLS

Languages and web: JavaScript, TypeScript, Node.js, Python, HTML/CSS, React, Next.js, Vue.js

PHP: Working knowledge from a full university project; comfortable reading and extending an existing codebase, not my daily language.

Databases: SQL, PostgreSQL (Supabase), MySQL, Redis, schema design.

Design and documentation: Object-oriented design, REST API design, technical specifications, architecture decision records (30+ logged), test plans

Engineering practice: Automated testing, CI pipelines (GitHub Actions), debugging production faults, Git, Docker

EDUCATION

Bachelor of Computer Science | Swinburne University of Technology — Feb 2023 -- Feb 2026

- Major in Software Development. Positive Impact Award, 99aupairs (2026). Completing a Professional Year in ICT.
